1. Introduction

The Dune 2000 Mission Launcher is a tool initially created by FunkyFr3sh and currently maintained and updated with new features by Feda. The tool can load any Dune 2000 custom mission present in the game's missions directory.

The Mission Launcher's scope has been recently updated in version 1.2.0 to allow custom modded files per mission. This means that a player can create a campaign with 5 missions, as an example, with 3 of them being vanilla Dune 2000 gameplay and 2 using modded files, such as a Devastator buildable for House Atreides.

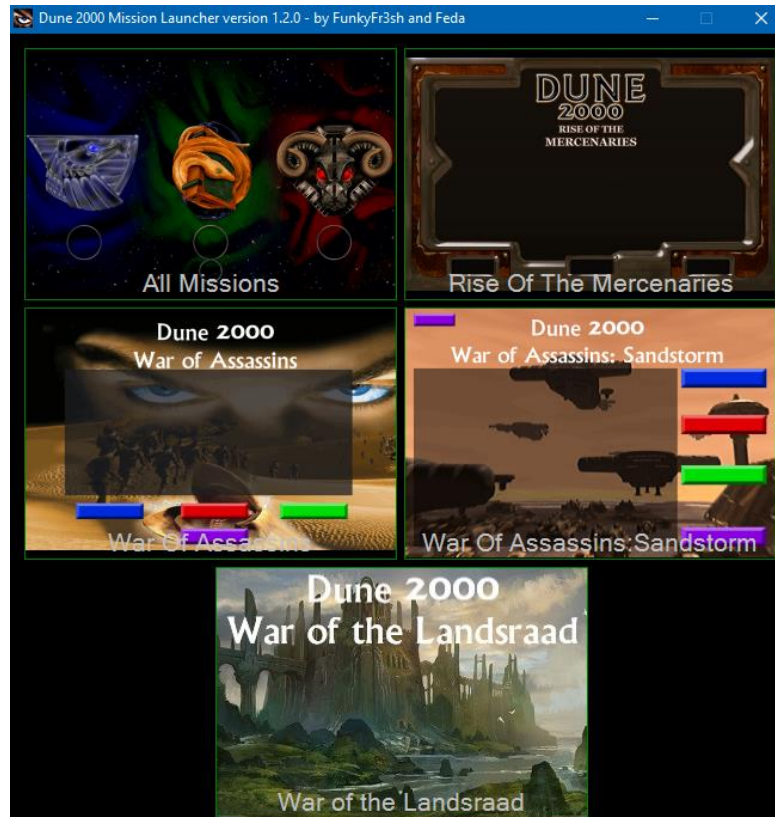

The new version of the Mission Launcher also provides support for loading a custom colours.uib file per mission, meaning that you can recolor the existing Houses.

All of these modded files get installed and uninstalled automatically by the launcher when you press the Start Mission button. The previous existing data files will get a backup.

2. How to use it as a normal player

Using the launcher as a normal user is extremely easy. All you have to do is open the MissionLauncher.exe.

Once done, you will see something like this.

A description of each section:

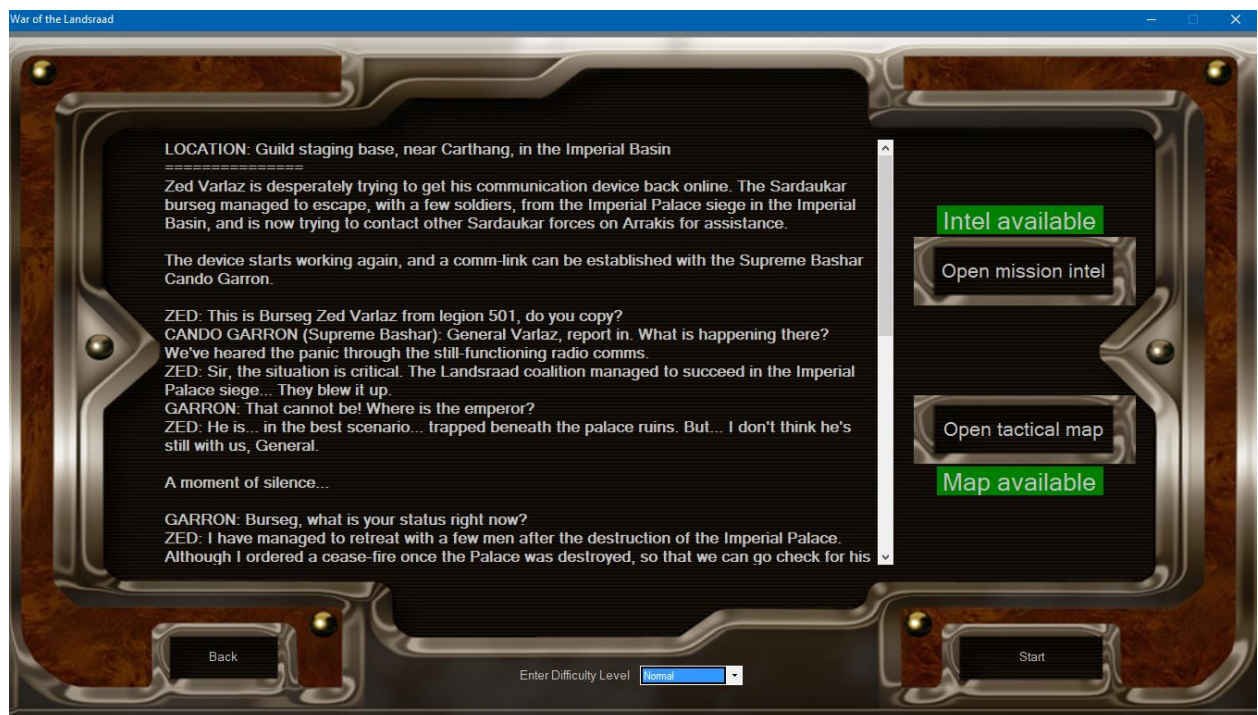

- All missions: has all missions that are located in the Missions folder. Literally all of them.
- Rise of the Mercenaries: A mercenary campaign created by GruntLord6
- War of Assassins: A campaign pack for Atreides, Harkonnen and Ordos created by Feda.

- War of Assassins: Sandstorm: The sequel to War of the Landsraad, created by Feda.
- War of the Landsraad: Follows on the ending of Sandstorm. Also created by Feda. It features 50 total new missions, 5 for the Sardaukar and 15 for each of the three Houses.

You can select any of these to load those respective missions.

2.1. Intel entries and tactical map

Inside the briefing menu, you can access a new intel and map button. If the map creator provided the necessary data, these buttons will launch a window with the respective information. It is advised to always click the buttons and read the information if it is available, as the map author has had a reason to include it.

2.2. Backups

The launcher itself should not crash usually, but you just never know what happens. Maybe you get a power shortage and the whole pc shuts down while you were playing and the mod files were installed, or maybe you really like pain and you decided to kill the MissionLauncher process for absolutely no reason because you are a bully. In that case, you have the original files inside your <Dune2000RootFolder>/MissionLauncherBackups, with exactly the same file structure as they normally are in the dune folders. I decided to not clean up this folder with the launcher, so you might want to clean it up once you don't need it anymore. It's really up to you man.

If you don't completely trust this tool, you might be a smart guy. In this case, go ahead and backup your Dune folder. This is ALWAYS recommended anyway, when working with mods.

3. For mission creators: using the new launcher

3.1. Folder structure

In order to take advantage of the new features of the launcher, you must follow a certain folder structure.

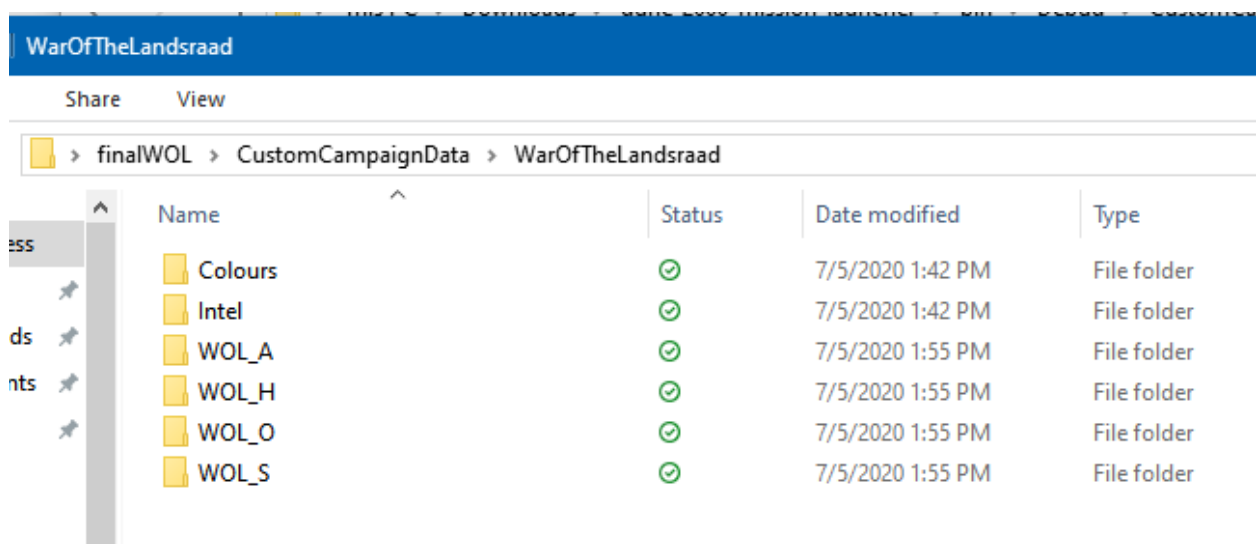

You must create a folder, in the Dune 2000 root, called *CustomCampaignData* (if it doesn't exist already). This folder will contain all campaign directories.

Inside, you need to create a folder. Name it whatever you want, but take note this is the folder you will use for your entire campaign.

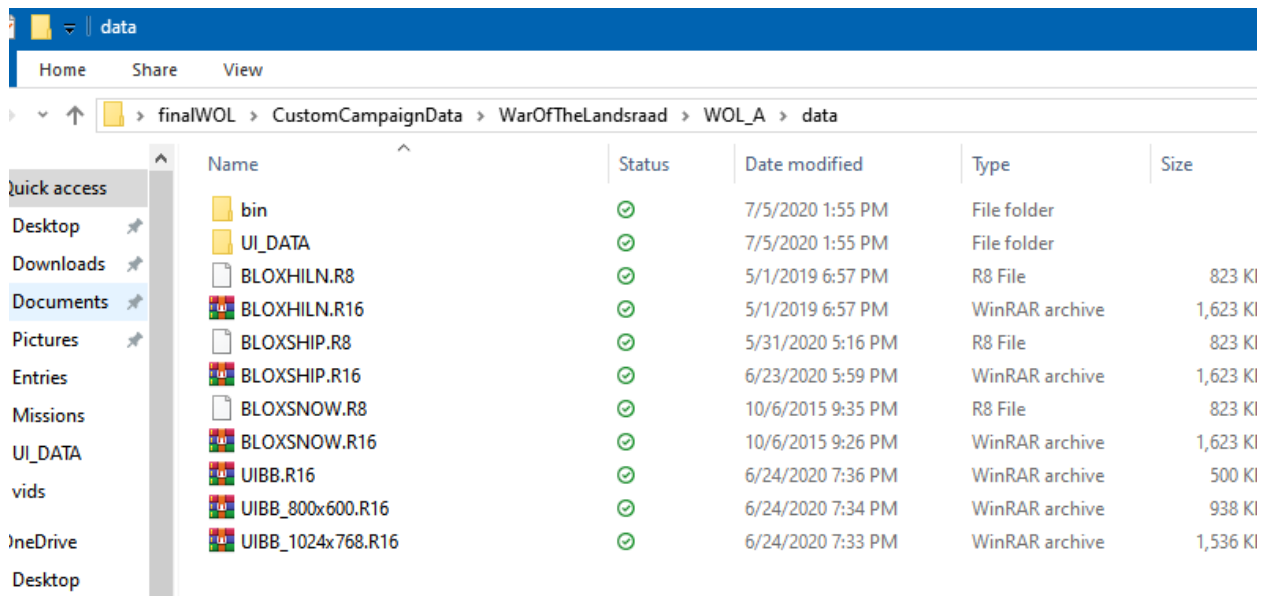

Example: Dune2000/CustomCampaignData/MyAmazingCampaign.

This folder can contain 3 things

- An *Intel* folder, where all the intel text and images must be placed, in a specific folder structure too
- One or more mod folders, which must follow the file structure of how Dune 2000 files are located. For example, to use a modded DATA.R16 you must create a folder “TestMod”, which will have a “data/DATA.R16” structure.
- A *Colours* folder, where you place all custom colours.uib files that you want to use.

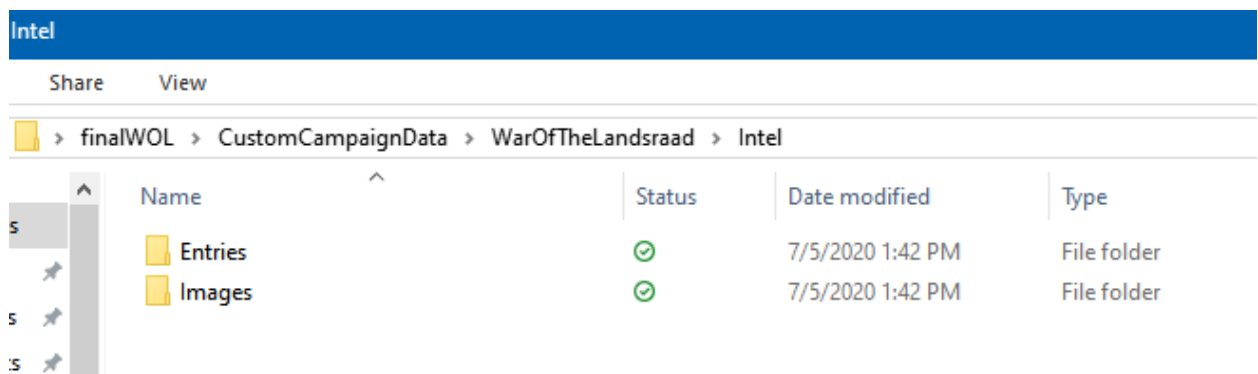

The above image is an example of how I structured my files for the War of the Landsraad campaign. I have a colours folder, an Intel folder, and one mod folder for each house: A = Atreides, H = Harkonnen, O = Ordos, S = Sardaukar.

As you can see, I am following the Dune file structure: anything that normally goes into the *data* folder is placed inside a custom data folder I created myself in the campaign folder. Check the paths in the Windows Explorer address bar.

The *data* folder inside your campaign folder must only contain the modded files, there is no reason to add vanilla files here. The launcher will install the files you place here when you open a mission.

The *Intel* folder must have an *Entries* and *Images* folder. Inside each of these, you will place either text files representing the intel text for your missions, or JPG images for the intel images OR the tactical maps.

The names of these files must follow a certain format that you define in your mission .ini file. More about this in the upcoming chapter.

3.1 How to edit your mission and link it to the CustomCampaignFolder

All these changes must be specified in the mission .ini file, because the launcher will read that file to find the right intel entries, mod files or images from the CustomCampaignData folder. Editing these in your mission is extremely simple by using Klofkac's map editor.

	Tech lvl	Credits	Alloc. index	Atreides	Harkon.	Ordos	Emperor	Fremen	Smuggl.	Mercen.	Sandworm
Atreides	7	10000	0	Ally	Enemy	Enemy	Enemy	Enemy	Ally	Enemy	Enemy
Harkonnen	7	9000	1	Enemy	Ally	Enemy	Enemy	Enemy	Ally	Ally	Enemy
Ordos	7	3000	2	Enemy	Enemy	Ally	Enemy	Enemy	Enemy	Enemy	Enemy
Emperor	7	3000	3	Enemy	Enemy	Enemy	Ally	Enemy	Enemy	Enemy	Enemy
Fremen	7	3000	0	Enemy	Enemy	Enemy	Enemy	Ally	Ally	Enemy	Enemy
Smugglers	7	3000	210	Ally	Ally	Enemy	Enemy	Ally	Ally	Ally	Enemy
Mercenaries	7	7000	6	Enemy	Ally	Enemy	Enemy	Enemy	Ally	Ally	Enemy
Sandworm	7	3000	7	Enemy	Enemy	Enemy	Enemy	Enemy	Enemy	Enemy	Ally

Colours.bin file:

Players.ini file:

Text.uib file:

- IntelID: This is the prefix your intel entries .txt filenames must have, along with the .jpg file names.
- CampaignFolder: This is the name of the campaign folder where you placed all your intel, mods or colors folders. This folder must be inside the CustomCampaignData folder.
- ModsFolder: this directory must always be located inside the Campaign folder, and is the directory that must contain the modded files for this particular mission.
- Colours.bin file: specify the name of the colours.bin file for this mission. The file must be located in the Colours folder, inside the CampaignFolder.

3.3. How to write your intel entries

As mentioned above, the Intel functionality requires you to stick to a specific file name format that you specify in the Map editor. For the above example, which is “A6”, our files would have to be named like “A6_1.txt, A6_2.txt, A6_3.txt, A6_4.txt” AND “A6_1.jpg, A6_2.jpg, A6_3.jpg, A6_4.jpg”. For the tactical map, it would be “Tactical_A6.jpg”

There can be maximum 4 intel entries or images and only one tactical map per mission.

The general format of the file names is “<IntelID>_<number>.txt” or .jpg. The <number> can be 1, 2, 3 or 4, depending on its order in the intel screen. The tactical map name must always be like “Tactical_<IntelID>.jpg”.

4. Assistance & help

If you have questions and issues, we have a Dune 2000 Singleplayer Discord server focused on Dune 2000 modding and mapping, please join and don't hesitate to ask the people there. The most experienced Dune 2000 mappers, modders and developers are there and can help you.
